Revision History

Version	Description	Date
V1.0.0	Initial release.	December 14, 2012
V1.0.1	Updates: 1. Corrected the **Do Not Beep on Unknown Character** and **Beep on Unknown Character** barcodes in the **"Beep on Unknown Character"** section in Chapter 5. 2. Removed four prefix sequence options in the **"Prefix Sequences"**section in Chapter 7: **Code ID + AIM ID+ Custom**, **AIM ID + Custom + Code ID, AIM ID + Code ID + Custom, Custom + AIM ID + Code ID**.	January 14,2013
V1.0.2	Updates: Replaced hard-to-read barcodes.	April 12, 2013

Table of Contents

Preface

Introduction

This manual provides detailed instructions for setting up and using the NLS-HR32 series corded 2D barcode scanner NLS-HR3250-XX (hereinafter referred to as "**HR32 corded scanner**").

Chapter Description

- ✧ *Chapter 1, Getting Started* : Gives a general description of HR32 corded scanner including its technical parameters.
- ✧ *Chapter 2, QuickSet* : Introduces a useful tool you can use to set up HR32 corded scanner and develop new applications.
- ✧ *Chapter 3, System Settings* : Introduces three configuration methods and describes how to configure general parameters of HR32 corded scanner.
- ✧ *Chapter 4, RS-232 Interface* : Describes how to configure RS-232 communication parameters.
- ✧ *Chapter 5, USB Interface* : Describes how to configure USB communication parameters.
- ✧ *Chapter 6, Symbologies* : Lists all compatible symbologies and describes how to configure the relevant parameters..
- ✧ *Chapter 7, Prefix & Suffix* : Describes how to use prefix and suffix to customize scanned data.
- ✧ *Chapter 8, Data Extraction & Packing* : Describes how to extract a particular portion of scanned data and to enable data packing feature.
- ✧ *Chapter 9, Batch Programming* : Explains how to integrate a complex programming task into a single barcode.
- ✧ *Appendix* : Provides factory defaults table and a bunch of frequently used programming barcodes.

Explanation of Icons

This icon indicates something relevant to this manual.

This icon indicates this information requires extra attention from the reader.

This icon indicates handy tips that can help you use or configure the scanner with ease.

This icon indicates practical examples that can help you to acquaint yourself with operations.

Chapter 1 Getting Started

Introduction

The HR32 corded scanner reads a 1D or 2D barcode by capturing its image. Adopting the advanced UIMG technology independently developed by Newland Auto-ID Tech, it provides users with three scan modes, including Manual Mode, Sense Mode and Continuous Mode, tailored to different scanning needs.

An illustrated introduction to the HR32 corded scanner is included in this chapter. If you have an HR32 corded scanner at hand, make good use of it to develop a better understanding of this manual. This chapter is written for normal users, maintenance staff and software developers.

Features of the HR32

- Comprehensive data capture: most 1D and 2D barcodes including Chinese Sensible Code.
- Fast and accurate decoding capability: integrates high-performance processor and barcode decoder board.
- Easy to configure and update.

Unpacking

Open the package and take out HR32 corded scanner and its accessories. Check to make sure everything on the packing list is present and intact. If any contents are damaged or missing, please keep the original package and contact your dealer immediately for after-sale service.

HR32 Corded Scanner

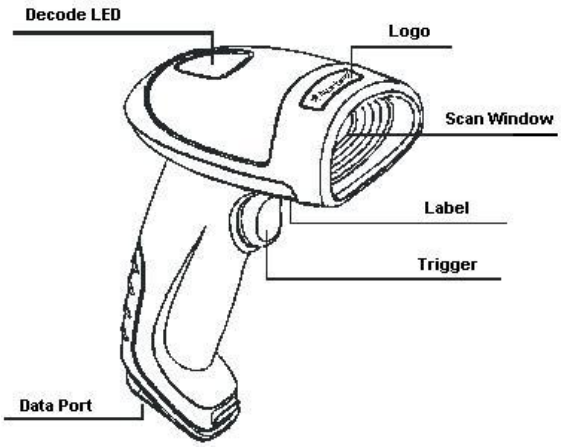

Fig. 1-1

Decode LED Definitions

Red : Scanner is powered on.

Green: Barcode is decoded successfully.

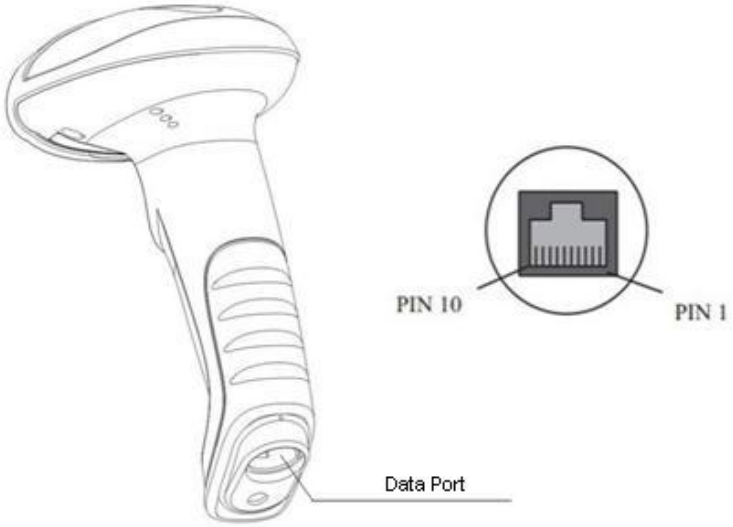

Fig. 1-2

PIN	Signal	Type	Function
1	NC	-	No connection
2	NC	-	No connection
3	VCC	P	Power+ (+5V)
4	TXD	O	RS-232 output
5	RXD	I	RS-232 input
6	NC	-	No connection
7	NC	-	No connection
8	GND	P	Ground
9	D-	I/O	USB signal
10	D+	I/O	

Connect HR32 to a Host

The HR32 corded scanner must be connected to a Host in actual application, such as PC, POS or any intelligent terminal with USB or RS-232 port, via a communication cable, either USB or RS-232 cable.

USB

USB port on the Host 
RS-232

RS-232 port on the Host 

Use USB Cable

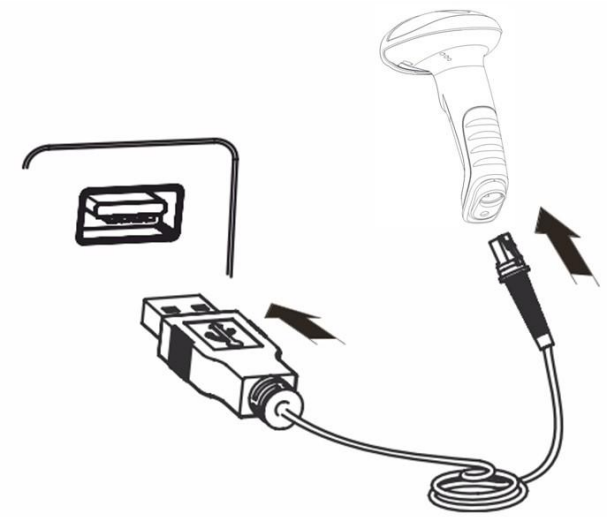

Fig. 1-3

Connect the HR32 corded scanner to a Host through a USB cable with RJ45 and USB connectors:

1. Plug the RJ45 connector into the data port (see Fig.1-1) on the HR32 corded scanner.
2. Plug the USB connector into the USB port on the Host.

Use RS-232 Cable

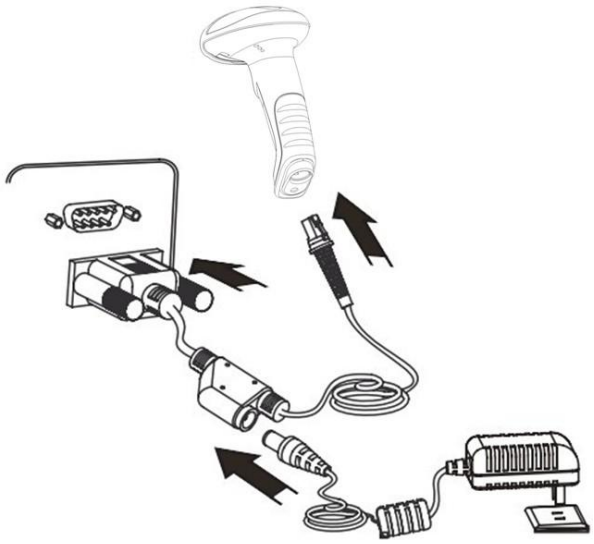

Fig. 1-4

Connect the HR32 corded scanner to a Host through a RS-232 cable with RJ45, RS-232 and power connectors:

1. Plug the RJ45 connector into the data port (see Fig.1-1) on the HR32 corded scanner.
2. Plug the RS-232 connector into the RS-232 port on the Host.
3. Connect the supplied power adaptor to the power connector of the RS-232 cable.

Remove Communication Cable

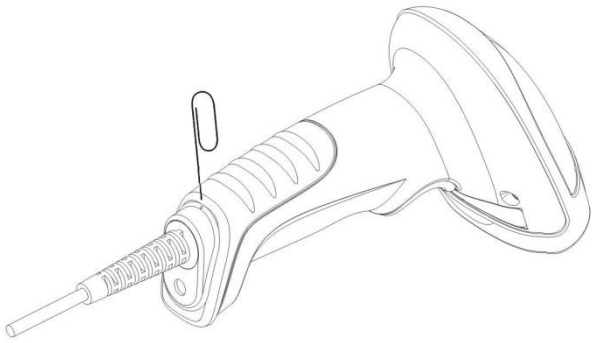

Fig. 1-5

Get an appropriate needle or a straightened paper clip (Fig. 1-5) and then follow the steps below:

1. Disconnect the power adaptor from mains if there is one.
2. Insert the needle into the hole.
3. Pull out the cable slowly from the scanner while pressing the needle in.
4. Remove the needle.
5. Disconnect the cable from the Host.

Power On, Sleep, Power Off, Reboot

Power on the scanner

Connect the HR32 corded scanner to a Host. Then the scanner will be turned on and automatically enter the sleep mode.

Enter the sleep mode

If no operation is performed on the device for some time, the device will automatically enter the sleep state.

Power off the scanner

Remove the communication cable from the HR32 corded scanner; or remove the USB cable from the Host; or disconnect the power adaptor from mains.

Reboot the scanner

If the HR32 corded scanner stops responding to input or runs abnormally, turn off the scanner and then turn it back on.

Maintenance

- ✧ The scan window should be kept clean.
- ✧ Do not scratch the scan window.
- ✧ Use soft brush to remove the stain from the scan window.
- ✧ Use the soft cloth to clean the window, such as eyeglass cleaning cloth.
- ✧ Do not spray any liquid on the scan window.
- ✧ Do not use any detergent to clean other parts of the device except for water.

The warranty **DOES NOT** cover damages caused by inappropriate care and maintenance.

Depth of Field

Barcode Density	Symbology	HR3250-SX(mm)
5 mil	Code 39	45 ～ 210
13 mil	UPC-A	55 ～ 295
20 mil	Code 39	45 ～ 365
6.67 mil	PDF417	30 ～ 160
10 mil	Data Matrix	15 ～ 170
20 mil	QR	15 ～ 265
30 mil	QR	25 ～ 340

Specifications

Performance

Scanning Instructions

When the HR32 corded scanner is in the Manual scan mode, you can follow the steps below to scan a barcode:

- Press and hold the Trigger (see Fig.1-1). Then the scanner will project a red aiming beam.
- Aim the red beam across the center of barcode, as shown in Fig.1-9.
- Release the Trigger when the red beam goes off. If the barcode is decoded successfully, the scanner will emit a good decode beep and the decoded data will be sent to the Host.

Note: For the same batch of barcodes, the scanner will keep a very high success ratio in certain distance which can be regarded as the optimal scanning distance.

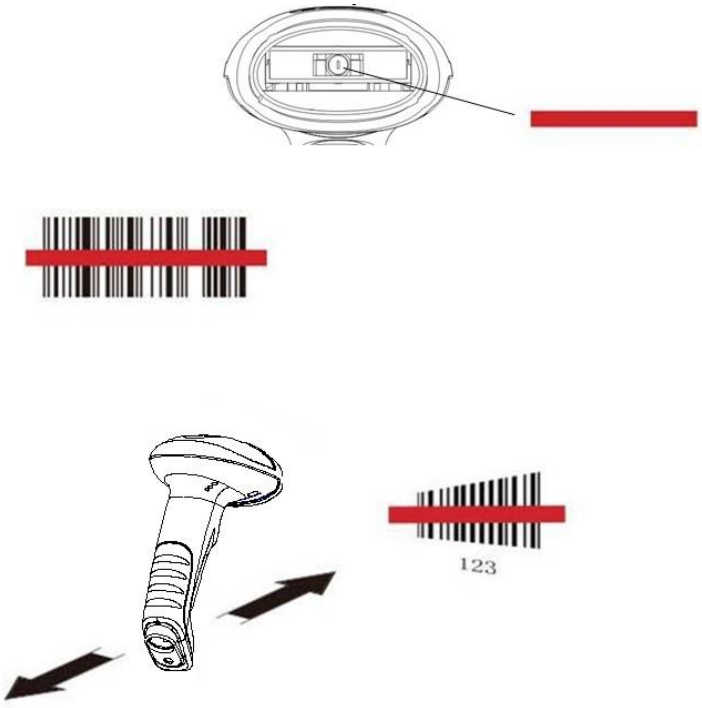

Fig. 1-9

Chapter 2 QuickSet

QuickSet is Windows-based barcode reading software developed by Newland Auto-ID Tech. Users can use it to develop applications, troubleshoot problems and configure HR32 corded scanners.

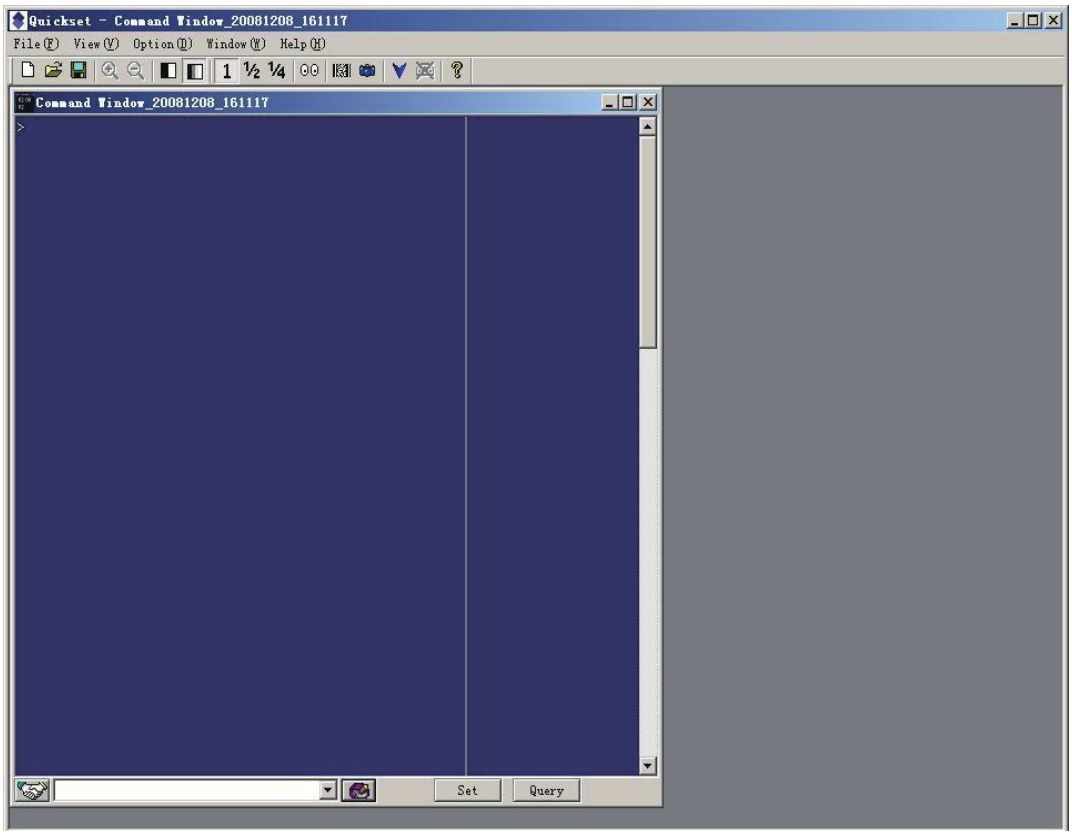

Fig. 2-1

【Enter Setup】

Chapter 3 System Settings

Introduction

There are three ways to configure the HR32 corded scanner: barcode programming, command programming and QuickSet programming.

Barcode Programming

The HR32 corded scanner can be configured through scanning programming barcodes. In the following sections, we will explain the available options and features and provide the barcodes to program them.

This programming method is most straightforward. However, it requires manually scanning barcodes. As a result, errors are more likely to occur.

Command Programming

The HR32 corded scanner can also be configured by command strings sent from the Host. In the following sections, the commands will be provided along with programming barcodes.

Users can also design an application to send those command strings to their scanners.

QuickSet Programming

Besides the two methods mentioned above, you can conveniently perform scanner configuration through QuickSet too. QuickSet is a Windows-based GUI program, enabling users to gain access to decoded data and captured images and to configure scanners.

This method is quite similar to the command programming. QuickSet is a software program particularly designed for Newland products.

Note: All settings except temporary ones are stored in non-volatile memory of the scanner and will not be lost by removing power from the scanner.

Programming Barcode/Command/Function

The figure above is an example that shows you the programming barcode and command for the Exit Setup function:

1. The **Exit Setup** barcode
2. The **Exit Setup** command
3. The function/feature that can be enabled by using the programming barcode or command listed above.
4. ** indicates factory default settings.

Use of Programming Barcodes

Scanning the **Enter Setup** barcode can enable the scanner to enter the setup mode. Then you can scan a number of programming barcodes to configure your scanner. To exit the setup mode, scan the **Exit Setup** barcode.

Some functions or options may involve parameter value settings that require scanning numeric barcodes. To find the numeric barcodes, see the "**Digit Barcodes**" section in **Appendix**.

Illumination

A couple of illumination options are provided to improve the lighting conditions during every image capture:

- ✧ **Wink:** Illumination LED flashes when scanner is reading barcode.
- ✧ **Always ON**: Illumination LED keeps ON after scanner is powered on.
- ✧ **ON When Reading:** Illumination LED is turned on when scanner is reading barcode.
- ✧ **OFF:** Illumination LED is OFF all the time.

Beep Definitions

Beep Sequence	Indication
4 ascending beeps	Power up (startup).
1 beep	A non-programming barcode was decoded (if the Decode Beep is enabled).
2 beeps	A programming barcode was decoded (if the Decode Beep is enabled).
3 short low beeps and 2 high beeps	The scanner failed to decode a barcode (if the Decode Beep is enabled).
1 long low beep	The scanner detected an unknown character when using USB HID-KBW (if the Beep on Unknown Character is enabled).

Scan Mode

- ✧ **Manual Mode:** A trigger pull activates a decode session. The decode session continues until the barcode is decoded or you release the trigger.
- ✧ **Sense Mode:** The scanner activates a decode session every time when it detects a change in ambient illumination. The decode session continues until the barcode is decoded or the Decode Session Timeout occurs. Pressing the trigger can also activate a decode session.
- ✧ **Continuous Mode:** Pressing the trigger activates a decode session. The decode process continues until the barcode is decoded. After finishing a decode session, the scanner automatically starts a new session until you press the trigger a second time.

0302000

Decode Session Timeout & Timeout Between Decodes (Same Barcode)

- **Decode Session Timeout:** This parameter sets the maximum time decode session continues during a scan attempt in the Sense Mode. It is programmable in 1ms increments from 500ms to 3600000ms. The default timeout is 3000ms.
- **Timeout Between Decodes (Same Barcode):** This parameter sets the timeout between decodes for the same barcode in the Sense Mode or Continuous Mode. It is programmable in 1ms increments from 1ms to 3600000ms. The default timeout is 1500ms.

0313000

【Decode Session Timeout】

0313010

【Timeout Between Decodes (Same Barcode)】

0006000

**【Exit Setup】

【Enter Setup】

To enable/disable the Timeout Between Decodes (Same Barcode), scan the appropriate barcode below.

- ✧ **Enable Timeout Between Decodes:** Do not allow the scanner to re-read the same barcode before the Timeout Between Decodes (Same Barcode) occurs.
- ✧ **Disable Timeout Between Decodes:** Allow the scanner to re-read the same barcode.

****【Disable Timeout Between Decodes】**

【Enable Timeout Between Decodes】

Example

Set the Decode Session Timeout to 1500ms:

1. Scan the **Enter Setup** barcode.
2. Scan the **Decode Session Timeout** barcode.
3. Scan the numeric barcodes “1”, “5”, “0” and “0”. (See the “**Digit Barcodes**” section in **Appendix**)
4. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
5. Scan the **Exit Setup** barcode.

****【Exit Setup】**

【Enter Setup】

Cell Phone Read Mode

If this mode is enabled, the scanner will be able to read barcodes displayed on the cell phone.

****【Disable Cell Phone Read Mode】**

【Enable Cell Phone Read Mode】

Decode Area

Whole Area Decoding

The scanner attempts to decode barcode(s) within its field of view and transmits the barcode that has been first decoded.

Central Area Decoding

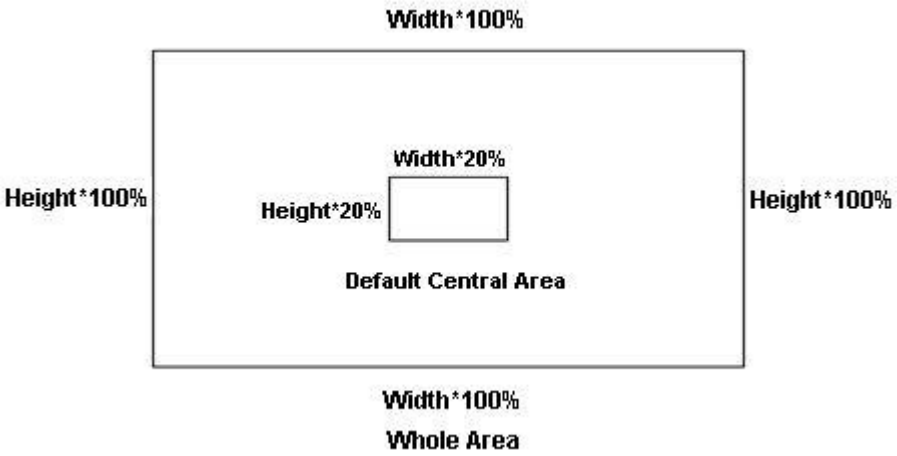
The scanner attempts to decode barcode(s) within a specified central area and transmits the barcode that has been first decoded. This feature allows the scanner to narrow its field of view to make sure the scanner reads only those barcodes intended by the user. For instance, if multiple barcodes are placed closely together, central area decoding will insure that only the desired barcode is read.

0006010

【Enter Setup】

Specify Central Area

The default central area is a (Width*20%) by (Height*20%) area in the center of the scanner's field of view, as shown in the figure below. You can define the central area by scanning the **Specify Central Area** barcode and numeric barcode(s) corresponding to a desired percentage (1-100). If Central Area Decoding is enabled by scanning the **Central Area Decoding** barcode, the scanner only reads barcodes that intersect the predefined central area.



0322000

**【Whole Area Decoding】

0322010

【Central Area Decoding】

0322020

【Specify Central Area】

Default Settings

Factory Defaults

Scanning the following barcode can restore the scanner to the factory defaults.
You may need to reset all parameters to the factory defaults when:

- ✧ scanner is not properly configured so that it fails to decode barcodes.
- ✧ you forget previous configuration and want to avoid its impact.

0001000

**【Restore All Factory Defaults】

Custom Defaults

Scanning the **Restore All Custom Defaults** barcode can reset all parameters to the custom defaults. Scanning the **Save as Custom Defaults** can set the current settings as custom defaults.

Custom defaults are stored in the non-volatile memory.

0001150

【Save as Custom Defaults】

0001160

【Restore All Custom Defaults】

Restoring the scanner to the factory defaults will not remove the custom defaults from the scanner.

0006000

**【Exit Setup】

Product Information

- ✧ **Obtain Product Information:** Transmit the product information to the Host straight away.
- ✧ **Send Product Information at Startup:** Transmit the product information to the Host when the scanner is powered on. This feature only applies to scanners using an RS-232 interface.

0003000
【Obtain Product Information】

0007000
****【Do Not Send Product Information at Startup】**

Chapter 4 RS-232 Interface

Introduction

When the scanner is connected to the RS-232 port of a Host, the scanner will select **RS-232 Connection** by default. However, you need to set communication parameters (including baud rate, parity check, data bit and stop bit) to match the Host.

The **RS-232 Connection** barcode is used when the scanner is connected to the RS-232 port of a Host.

1100000

【RS-232 Connection】

RS-232 Parameters

When the scanner is connected to the Host via serial port, it is necessary to maintain consistency in communication parameters configuration on both devices to ensure smooth communication between them.

0006000

**【Exit Setup】

0006010

【Enter Setup】

Baud Rate

Baud rate is the number of bits of data transmitted per second. Set the baud rate to match the Host requirements. The default baud rate is 9600 bps.

0100030

****【Baud Rate 9600】**

0100000

【Baud Rate 1200】

0100010

Data Bit

Set the number of data bits to match the Host requirements. The default setting is 8 Data Bits.

**【8 Data Bits】

【6 Data Bits】

【7 Data Bits】

【5 Data Bits】

Stop Bit

The stop bit(s) at the end of each transmitted character marks the end of transmission of one character and prepares the receiving device for the next character in the serial data stream. Set the number of stop bits to match the Host requirements. The default setting is 1 Stop Bit.

**【1 Stop Bit】

【2 Stop Bits】

**【Exit Setup】

0006010

【Enter Setup】

Hardware Auto Flow Control

If this feature is enabled, the scanner determines whether to transmit data based on CTS signal level. When CTS signal is at a low level which means the serial port's cache memory of receiving device (such as PC) is full, the scanner sends data through RS-232 port until CTS signal is set to high level by receiving device. When the scanner is not ready for receiving, it will set RTS signal to low level. When sending device (such as PC) detects it, it will not send data to the scanner any more to prevent data loss.

If this feature is disabled, reception/transmission of serial data will not be influenced by RTS/CTS signal.

0104000

****【Disable Hardware Auto Flow Control】**

0104010

【Enable Hardware Auto Flow Control】

Before enabling this feature, make sure that RTS/CTS signal line is contained in RS-232 cable. Without the signal line, RS-232 communication errors will occur.

0006000

****【Exit Setup】**

【Enter Setup】

Chapter 5 USB Interface

Introduction

There are four options for USB connection.

- ✧ USB HID-KBW: The scanner's transmission is simulated as USB keyboard input with no need for command configuration or a driver. The barcode data could be entered by the virtual keyboard directly and it is also convenient for the Host to receive data.
- ✧ USB DataPipe: USB DataPipe is a transport protocol developed by Newland Auto-ID Tech, which requires installation of a specific driver on the Host. It supports data transmission and device configuration on QuickSet. The DataPipe driver for Windows is available at http://www.nlscan.com.
- ✧ USB COM Port Emulation: The USB port on the Host is emulated as a RS-232 port with the same data transmission and configuration as a real RS-232 port. This mode is based on USB DataPipe protocol and requires the USB DataPipe driver, too.
- ✧ HID-POS: It is based on the HID interface, with no need of a custom driver. It excels virtual keyboard and traditional RS-232 interface in transmission speed.

When the scanner is connected to both USB and RS-232 ports on a Host, it will select the USB connection by default.

**【Exit Setup】

0006010

【Enter Setup】

USB HID-KBW

When the scanner is connected to the USB port on a Host, you can enable the USB HID-KBW feature by scanning the barcode below. Then scanner's transmission will be simulated as USB keyboard input. The Host receives keystrokes on the virtual keyboard. It works on a Plug and Play basis and no driver is required.

1100020

【USB HID-KBW】

If the Host allows keyboard input, then no extra software is needed for HID-KBW input.

USB Country Keyboard Types

Keyboard layouts and country codes vary from country to country. The default setting is US keyboard type. Follow the steps below to program the keyboard type for your country or language.

1. Scan the **Enter Setup** barcode.
2. Scan the **Select Country Code** barcode.
3. Scan the code of your country. (See the “Country CodeTable”)
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.

1103000

【Select Country Code】

Example

Program the scanner to emulate Norwegian keyboard (Norway):

1. Scan the **Enter Setup** barcode.
2. Scan the **Select Country Code** barcode.
3. Scan the numeric barcodes “1” and “5”. (See the “**Digit Barcodes**” section in **Appendix**))
4. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
5. Scan the **Exit Setup** barcode.

0006010

【Enter Setup】

Beep on Unknown Character

Due to the differences in keyboard layouts, some characters contained in barcode data may be unavailable on the selected keyboard. As a result, the scanner fails to transmit the unknown characters.

Scan the appropriate barcode below to enable or disable the emission of beep when an unknown character is detected.

1103030

**【Do Not Beep on Unknown Character】

1103031

【Beep on Unknown Character】

Example

Supposing French keyboard (Country Code: 7) is selected and barcode data ”AÐF” is being dealted with, the keyboard will fail to locate the “Ð” (0xD0) character and the scanner will ignore the character and continue to process the next one.

Do Not Beep on Unknown Character: The scanner does not beep and the Host receives “AF”.

Beep on Unknown Character: The scanner beeps and the Host still receives “AF”.

0006000

**【Exit Setup】

0006010

【Enter Setup】

Emulate ALT+Keypad

When Emulate ALT+Keypad is turned on, any ASCII character (0x00 - 0xff) is sent over the numeric keypad no matter which keyboard type is selected.

1. ALT Make
2. Enter the number corresponding to a desired character on the keypad.
3. ALT Break

1103060

**【Emulate ALT+Keypad OFF】

1103061

【Emulate ALT+Keypad ON】

Since sending a character involves multiple keystroke emulations, this method appears less efficient.

Supposing French keyboard (Country Code: 7) is selected and **Emulate ALT+Keypad** is ON, barcode data ”AÐF” (65/208/70) is sent as below:

“A” – “ALT Make” + “065” + “ALT Break”

“Ð” -- “ALT Make” + “208” + “ALT Break”

“F” -- “ALT Make” + “070” + “ALT Break”

0006000

**【Exit Setup】

0006010

【Enter Setup】

Function Key Mapping

When Function Key Mapping is enabled, function character (0x00 - 0x1F) are sent as ASCII sequences over the numeric keypad.

1. CTRL Make
2. Press function key
3. CTRL Break

1103130

**【Disable Function Key Mapping】

1103140

【Enable Function Key Mapping】

Example

Supposing the **Function Key Mapping** feature is enabled and other parameters of USB HID-KBW adopt factory defaults, barcode data “A<HT>(i.e. Horizontal Tab)F” (0x41/0x09/0x46) is sent as below:

1. “A” - Keystroke “A”.
2. “Ctrl I” - “Ctrl Make” + Keystroke “I” + “Ctrl Break”
3. “F” - Keystroke “F”

For some text editors, “Ctrl I” means italic convert. So the output may be “A*F*”.

Emulate ALT+Keypad ON prevails over **Enable Function Key Mapping**.

0006000

**【Exit Setup】

Inter-Keystroke Delay

This parameter specifies the delay between emulated keystrokes.

1103050
**【No Delay】

1103052
【Long Delay (40ms)】

1103051
【Short Delay (20ms)】

0006010

【Enter Setup】

Caps Lock

The **Caps Lock ON** option can invert upper and lower case characters contained in barcode data. This inversion occurs regardless of the state of Caps Lock key on the Host's keyboard.

1103010

**【Caps Lock OFF】

1103020

【Caps Lock ON】

Emulate ALT+Keypad ON/ **Convert All to Upper Case**/ **Convert All to Lower Case** prevails over **Caps Lock ON**.

Example

When the **Caps Lock ON** is selected, barcode data "AbC" is transmitted as "aBc".

0006000

**【Exit Setup】

Convert Case

Scan the appropriate barcode below to convert all bar code data to your desired case.

1103040
**【No Case Conversion】

1103042
【Convert All to Lower Case】

1103041
【Convert All to Upper Case】

Example When the **Convert All to Lower Case** feature is enabled, barcode data “AbC” is transmitted as “abc”.

0006010

【Enter Setup】

Emulate Numeric Keypad

When this feature is disabled, sending barcode data is emulated as keystroke(s) on main keyboard.

To enable this feature, scan the **Emulate Numeric Keypad** barcode. Sending a number (0-9) is emulated as keystroke(s) on numeric keypad, whereas sending other character like “+”, “_”, “*” , “/” and “.” is still emulated as keystrokes on main keyboard.

Numeric keypad is usually situated at the right of the main keyboard. The state of Num Lock on the simulated numeric keypad is determined by its equivalent on the Host. If Num Lock on the Host is turned off, the output of simulated numeric keypad is function key instead of number.

1103110

**【Do Not Emulate Numeric Keypad】

1103120

【Emulate Numeric Keypad】

Make sure the Num Lock light of the Host is turned ON before enabling this feature.

Emulate ALT+Keypad ON prevails over **Emulate Numeric Keypad**.

0006000

**【Exit Setup】

0006010

【Enter Setup】

Supposing the **Emulate Numeric Keypad** feature is enabled:

if Num Lock on the Host is ON, “A4.5” is transmitted as “A4.5”;

if Num Lock on the Host is OFF, “A4.5” is transmitted as follows:

1. “A” is sent as is because it is not included in numeric keypad;
2. “4” is sent as the function key “Cursor Move to Left”;
3. “.” is sent as the function key “Delete After the Cursor”;
4. “5” is not sent as it does not correspond to any function key.

0006000

USB DataPipe

This protocol is defined by Newland. A driver is required when using this protocol to communicate with scanner.

Its advantages include fast data transmission and easy integration of the SDK into application system.

【USB DataPipe】

**【Exit Setup】

0006010

【Enter Setup】

USB COM Port Emulation

If your scanner is connected to the USB port on a Host, the USB COM Port Emulation feature allows the Host to receive data in the way as a serial port does. However, you need to set communication parameters on the scanner to match the Host requirements. To learn how to program communication parameters, see the **"RS-232 Parameters"** section in Chapter 4.

1100060

【USB COM Port Emulation】

HID-POS

Introduction

The HID-POS interface is recommended for new application programs. It can send up to 56 characters in a single USB report and appears more efficient than keyboard emulation.

Features:

- ✧ HID based, no custom driver required.
- ✧ Way more efficient in communication than keyboard emulation and traditional RS-232 interface.

Note: HID-POS does not require a custom driver. However, a HID interface on Windows 98 does. All HID interfaces employ standard driver provided by the operating system. Use defaults when installing the driver.

1100080

【HID-POS】

【Enter Setup】

Access the Scanner with Your Program

Use CreateFile to access the scanner as a HID device and then use ReadFile to deliver the scanned data to the application program. Use WriteFile to send data to the scanner.

For detailed information about USB and HID interfaces, go to www.USB.org.

Acquire Scanned Data

After a barcode is decoded, the scanner sends an input report as below:

	Bit							
Byte	7	6	5	4	3	2	1	0
0	Report ID = 0x02							
1	Barcode Length							
2-57	Decoded Data (1-56)							
58-61	Reserved (1-4)							
62	Newland Symbology Identifier or N/C: 0x00							
63	-	-	-	-	-	-	-	Decode Data Continued

VID/PID

USB uses VID (Vendor ID) and PID (Product ID) to identify and locate a device. The VID is assigned by USB Implementers Forum. Newland's vendor ID is 1EAB (Hex). A range of PIDs are used for each Newland product family. Every PID contains a base number and interface type (keyboard, COM port, etc.).

Product	Interface	PID (Hex)	PID (Dec)
HR32	Base	0000	0
	HID POS	0010	16

Chapter 6 Symbologies

Introduction

Every symbology (barcode type) has its own unique attributes. This chapter provides programming barcodes for configuring the scanner so that it can identify various barcode symbologies. The more symbologies you enable, the slower your scanner decodes. It is recommended to disable those that are rarely used to improve the performance of the scanner.

General Settings

Disable All Symbologies

If the **Disable All Symbologies** feature is enabled, the scanner can only identify the programming barcodes.

【Disable All Symbologies】

Enable All Symbologies

If the **Enable All Symbologies** feature is enabled, the scanner will be able to read all compatible barcode symbologies as well as the programming barcodes.

【Enable All Symbologies】

**【Exit Setup】

【Enter Setup】

0006000

**【Exit Setup】

【Enter Setup】

Set Length Range for Code 128

The scanner can be configured to only decode Code 128 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

【Set the Minimum Length (Default: 1)】

【Set the Maximum Length (Default: 48)】

If minimum length is set to be greater than maximum length, the scanner only decodes Code 128 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Code 128 barcodes with that length are to be decoded.

Set the scanner to decode Code 128 barcodes containing between 8 and 12 characters:

1. Scan the **Enter Setup** barcode.
2. Scan the **Set the Minimum Length** barcode.
3. Scan the numeric barcode “8”. (See the “**Digit Barcodes**” section in **Appendix**)
4. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
5. Scan the **Set the Maximum Length** barcode.
6. Scan the numeric barcode “1”.
7. Scan the numeric barcode “2”.
8. Scan the **Save** barcode.
9. Scan the **Exit Setup** barcode.

**【Restore the Factory Defaults of Interleaved 2 of 5】

Enable/Disable Interleaved 2 of 5

0405020

**【Enable Interleaved 2 of 5】

0405010

【Disable Interleaved 2 of 5】

If the scanner fails to identify Interleaved 2 of 5 barcodes, you may first try this solution by scanning the **Enter Setup** barcode and then **Enable Interleaved 2 of 5** barcode.

0006000

**【Exit Setup】

0006010

【Enter Setup】

Set Length Range for Interleaved 2 of 5

The scanner can be configured to only decode Interleaved 2 of 5 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

0405030

【Set the Minimum Length (Default: 6)】

0405040

【Set the Maximum Length (Default: 80)】

If minimum length is set to be greater than maximum length, the scanner only decodes Interleaved 2 of 5 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Interleaved 2 of 5 barcodes with that length are to be decoded.

Set the scanner to decode Interleaved 2 of 5 barcodes containing between 8 and 12 characters:

1. Scan the **Enter Setup** barcode.
2. Scan the **Set the Minimum Length** barcode.
3. Scan the numeric barcode “8”. (See the “**Digit Barcodes**” section in **Appendix**)
4. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
5. Scan the **Set the Maximum Length** barcode.
6. Scan the numeric barcode “1”.
7. Scan the numeric barcode “2”.
8. Scan the **Save** barcode.
9. Scan the **Exit Setup** barcode.

0006000

**【Exit Setup】

0006010

【Enter Setup】

Parity Check

A check digit is optional for Interleaved 2 o 5 and can be added as the last digit. It is a calculated value used to verify the accuracy of the data.

- **No Parity Check:** The scanner transmits Interleaved 2 of 5 barcodes as is.
- **Do Not Transmit Check Digit After Parity Check:** The scanner will run a parity check using the last digit of Interleaved 2 of 5 barcode as check digit. Barcodes passing the check will be transmitted except the last digit, whereas those failing it will not be transmitted.
- **Transmit Check Digit After Parity Check:** The scanner will run a parity check using the last digit of Interleaved 2 of 5 barcode as check digit. Barcodes passing the check will be transmitted, whereas those failing it will not be transmitted.

Since Interleaved 2 of 5 must always have an even number of digits, a zero may need to be added as the first digit when the check digit is added. The check digit is automatically generated when making Interleaved 2 of 5 barcodes.

0405050

**【No Parity Check】

0405060

【Do Not Transmit Check Digit After Parity Check】

0405070

【Transmit Check Digit After Parity Check】

If the **Do Not Transmit Check Digit After Parity Check** option is enabled, Interleaved 2 of 5 barcodes with a length that is less than the configured minimum length after having the check digit excluded will not be decoded. (For example, when the **Do Not Transmit Check Digit After Parity Check** option is enabled and the minimum length is set to 4, Interleaved 2 of 5 barcodes with a total length of 4 characters including the check digit cannot be read.)

0006000

**【Exit Setup】

0006010

【Enter Setup】

Set Discrete Lengths for Interleaved 2 of 5

The scanner can be configured to only decode Interleaved 2 of 5 barcodes within a specific length range or with a couple of discrete lengths. The length must be an even number not greater than 64 and consist of three digits (a leading zero or zeros may need to be added to meet the length requirement).

The discrete lengths become valid only when the **Enable the Discrete Lengths** option is enabled.

0405140

**【Disable the Discrete Lengths】

0405160

【Set a Discrete Length】

0405150

【Enable the Discrete Lengths】

0405170

【Delete a Discrete Length】

Set the scanner to decode Interleaved 2 of 5 barcodes containing either 12 or 24 characters:

1. Scan the **Enter Setup** barcode.
2. Scan the **Enable the Discrete Lengths** barcode.
3. Scan the **Set a Discrete Length** barcode.
4. Scan the numeric barcodes “0”, “1” and “2”. (See the “**Digit Barcodes**” section in **Appendix**)
5. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
6. Scan the **Set a Discrete Length** barcode.
7. Scan the numeric barcodes “0”, “2” and “4”.
8. Scan the **Save** barcode.
9. Scan the **Exit Setup** barcode.

0006010

【Enter Setup】

Set Length Range for Matrix 2 of 5

The scanner can be configured to only decode Matrix 2 of 5 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

【Set the Minimum Length (Default: 4)】

【Set the Maximum Length (Default: 80)】

If minimum length is set to be greater than maximum length, the scanner only decodes Matrix 2 of 5 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Matrix 2 of 5 barcodes with that length are to be decoded.

Set the scanner to decode Matrix 2 of 5 barcodes containing between 8 and 12 characters:

1. Scan the **Enter Setup** barcode.
2. Scan the **Set the Minimum Length** barcode.
3. Scan the numeric barcode “8”. (See the “**Digit Barcodes**” section in **Appendix**)
4. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
5. Scan the **Set the Maximum Length** barcode.
6. Scan the numeric barcode “1”.
7. Scan the numeric barcode “2”.
8. Scan the **Save** barcode.
9. Scan the **Exit Setup** barcode.

0006010

【Enter Setup】

Parity Check

A check digit is optional for Matrix 2 of 5 and can be added as the last digit. It is a calculated value used to verify the accuracy of the data.

- ✧ **No Parity Check:** The scanner transmits Matrix 2 of 5 barcodes as is.
- ✧ **Do Not Transmit Check Digit After Parity Check:** The scanner will run a parity check using the last digit of Matrix 2 of 5 barcode as check digit. Barcodes passing the check will be transmitted except the last digit, whereas those failing it will not be transmitted.
- ✧ **Transmit Check Digit After Parity Check:** The scanner will run a parity check using the last digit of Matrix 2 of 5 barcode as check digit. Barcodes passing the check will be transmitted, whereas those failing it will not be transmitted.

Since Matrix 2 of 5 must always have an even number of digits, a zero may need to be added as the first digit when the check digit is added. The check digit is automatically generated when making Matrix 2 of 5 barcodes.

0406050

【Set the Minimum Length (Default: 4)】

【Set the Maximum Length (Default: 48)】

If minimum length is set to be greater than maximum length, the scanner only decodes Plessey barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Plessey barcodes with that length are to be decoded.

Set the scanner to decode Plessey barcodes containing between 8 and 12 characters:

1. Scan the **Enter Setup** barcode.
2. Scan the **Set the Minimum Length** barcode.
3. Scan the numeric barcode “8”. (See the “**Digit Barcodes**” section in **Appendix**)
4. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
5. Scan the **Set the Maximum Length** barcode.
6. Scan the numeric barcode “1”.
7. Scan the numeric barcode “2”.
8. Scan the **Save** barcode.
9. Scan the **Exit Setup** barcode.

**【Exit Setup】

0006010

【Enter Setup】

Parity Check

Check digits are optional for Plessey and can be added as the last two digits, which are calculated values used to verify the accuracy of the data.

- ✧ **No Parity Check:** The scanner transmits Plessey barcodes as is.
- ✧ **Do Not Transmit Check Digit After Parity Check:** The scanner will run parity checks using the last two digits of Plessey barcode as check digits. Barcodes passing the checks will be transmitted except the last two digits, whereas those failing them will not be transmitted.
- ✧ **Transmit Check Digit After Parity Check:** The scanner will run parity checks using the last two digits of Plessey barcode as check digits. Barcodes passing the checks will be transmitted, whereas those failing them will not be transmitted.

0419050

【No Parity Check】

0419060

【Do Not Transmit Check Digit After Parity Check】

0419070

****【Transmit Check Digit After Parity Check】**

If the **Do Not Transmit Check Digit After Parity Check** option is enabled, Plessey barcodes with a length that is less than the configured minimum length after having the check digits excluded will not be decoded. (For example, when the **Do Not Transmit Check Digit After Parity Check** option is enabled and the minimum length is set to 4, Plessey barcodes with a total length of 4 characters including the check digits cannot be read.)

Chapter 7 Prefix & Suffix

Introduction

A 1D barcode could contain digits, letters, symbols, etc. A 2D barcode could contain more data, such as Chinese characters and other multi-byte characters. However, in real applications, they do not and should not have all information we need, such as barcode type, data acquisition time and delimiter, in order to keep the barcodes short and flexible.

Preffix and suffix are how to fulfill the needs mentioned above. They can be added, removed and modified while the original barcode data remains intact.

Barcode processing procedure:

1. Extract barcode data
2. Append prefix/suffix
3. Pack data
4. Append terminating character and transmit data

0006000

**【Exit Setup】

0006010

【Enter Setup】

General Settings

Enable/Disable All Prefix/Suffix

Disable All Prefix/Suffix: Transmit barcode data with no prefix/suffix.

Enable All Prefix/Suffix: Allow to append Code ID prefix, AIM ID prefix, custom prefix/suffix and terminating character to the barcode data before the transmission.

**【Disable All Prefix/Suffix】

【Enable All Prefix/Suffix】

Prefix Sequences

2 prefix sequence options:

【Code ID + Custom + AIM ID】

【Custom + Code ID + AIM ID】

0006010

【Enter Setup】

Custom Prefix

Enable/Disable Custom Prefix

If custom prefix is enabled, you are allowed to append to the data a user-defined prefix that cannot exceed 10 characters. For example, if the custom prefix is “AB” and the barcode data is “123”, the Host will receive “AB123”.

0305000

**【Disable Custom Prefix】

0305010

【Enable Custom Prefix】

Set Custom Prefix

To set a custom prefix, scan the **Set Custom Prefix** barcode and then the numeric barcodes corresponding to the hexadecimal value of a desired prefix. To save the settings, scan the **Save** barcode.

Note: A custom prefix cannot exceed 10 characters.

0300000

【Set Custom Prefix】

Example

Set the custom prefix to “CODE” (its hexadecimal value is 0x43/0x4F/0x44/0x45):

1. Scan the **Enter Setup** barcode.
2. Scan the **Set Custom Prefix** barcode.
3. Scan the numeric barcodes “4”,“3”,“4”,“F”,“4”,“4”,“4” and “5”. (See the “**Digit Barcodes**” section in **Appendix**)
4. Scan the **Save** barcode. (See the “**Save/Cancel Barcodes**” section in **Appendix**)
5. Scan the **Enable Custom Prefix** barcode.
6. Scan the **Exit Setup** barcode.

0006000

**【Exit Setup】

0006010

【Enter Setup】

AIM ID Prefix

AIM (Automatic Identification Manufacturers) ID defines symbology identifier (For the details, see the **"Appendix 2: AIM ID Table"** section). If AIM ID prefix is enabled, the scanner will add the symbology identifier before the scanned data after decoding.

0308000

****【Disable AIM ID Prefix】**

0308030

【Enable AIM ID Prefix】

AIM ID is not user programmable.

Code ID Prefix

Code ID can also be used to identify barcode type. Unlike AIM ID, Code ID is user programmable. Code ID can only consist of one or two English letters.

0307000

****【Disable Code ID Prefix】**

0307010

【Enable Code ID Prefix】

0006000

****【Exit Setup】**

Chapter 8 Data Extraction & Packing

Introduction

In real applications, barcode data could be divided into several sections, each of which delivers different information, such as the manufacturer ID and product ID. If you only want to transmit the product ID and ignore the manufacturer ID, data extraction can fill the bill. Data extraction makes it possible to transmit selected section(s) of raw barcode data.

Regular data transmission: Decode barcode—>Append prefix—>Append Suffix—>Append terminating character suffix—>Transmit data to the Host

Data transmission with extraction: Decode barcode—>Extract data—>Append prefix—>Append suffix—>Append terminating character suffix—>Transmit data to the Host

Data packing puts the desired data into a certain format.

Data transmission with extraction and packing: Decode barcode—>Extract data—>Append prefix—>Append suffix—> Pack data—>Append terminating character suffix—>Transmit data to the Host

Data Extraction

General Rule No.1: It is symbology specific extraction, which means barcodes of the same type can only adopt one extraction option.

General Rule No.2: The scanner allows up to three extraction options to be stored in the non-volatile memory. If more than three options are programmed, only the last three are to be stored. For instance, if an option is programmed for Code 128, Code 39, QR Code and UPC-A respectively, only the options for Code 39, QR Code and UPC-A will be stored.

General Rule No.3: If different options are programmed for a symbology, only the last option will be stored. For instance, Option A has been programmed for Code 128 and later Option B is programmed for the same barcode type, then Option A will be replaced by Option B.

To enable extraction option(s), scan the **Enable Extraction** barcode

**【Exit Setup】

0006010

【Enter Setup】

If you want to remove the extraction option of a barcode type, follow the steps below:

1. Scan the **Enter Setup** barcode.
2. Scan the **Erase the Extraction Option of a Symbology** barcode.
3. Scan the ID number of the barcode type. (e.g. EAN-13, its ID number is 005. For more information, see the "**Symbology ID Number**" section in **Appendix**)
4. Scan the **Save** barcode. (See the "**Save/Cancel Barcodes**" section in **Appendix**)
5. Scan the **Exit Setup** barcode.

0315000

0316030

【Erase All Extraction Options】

0006000

**【Exit Setup】

【Enter Setup】

Program 1D Extraction Option

When programming a 1D extraction option, you need to scan a string of decimal digit barcodes and obey the following rules:

- ✧ The extraction option is usually comprised of one barcode type section (symbology ID number) and one or more data extraction sections.
- ✧ A barcode type section is composed of a 3-digit symbology ID (e.g. “005”, EAN-13) while a data extraction section include 9 decimal digits, with the first 3 digits indicating extraction direction (000: extract from left to right; 001: extract from right to left), the next 3 digits indicating start position and the last 3 digits indicating end position.
- ✧ One extraction option can only apply to one barcode type.

**【Exit Setup】

【Enter Setup】

When scanning an EAN-13 barcode, send the leftmost character through the 3rd and the last 4th character through the rightmost of the data:

1. Scan the **Enter Setup** barcode.
2. Scan the **Enable Extraction** barcode.
3. Scan the **Program Extraction Option** barcode.
4. Scan the numberic barcodes in the following table, the **Save** barcode and the **Exit Setup** barcode.

Digit	005	000	001	003	001	004	001
Meaning	EAN-13 ID	Left to Right	Start with leftmost char	End with 3rd char	Right to Left	Start with last 4th char	End with rightmost char

Barcode Type Section **Data Extraction Section 1** **Data Extraction Section 2**

Note:

1. Up to 5 data extraction sections are allowed for one 1D extraction option.
2. Neither the start position nor end position can be greater than 127.
3. Data extraction sections can be overlapped. For instance, section 1: 1st character through the 5th (Left to Right); section 2: 2rd character through the 4th (Left to Right).
4. Start position can be greater than end position. In the example above, data extraction section 2 is “001 004 001”, that means the order of extraction is the last 4th, the last 3rd, the last 2nd and the rightmost.
5. To extract only one character, make start position equal to end position.

**【Exit Setup】

Program 2D Extraction Option

When programming a 2D extraction option, you need to scan a string of decimal digit barcodes and obey the following rules:

- ✧ The extraction option is usually comprised of one barcode type section (symbology ID number) and one or more data extraction sections.
- ✧ A barcode type section is composed of a 3-digit symbology ID (e.g. “033”, QR Code) while a data extraction section include 15 decimal digits, with the first 3 digits indicating extraction direction (000: extract from left to right; 001: extract from right to left), the next 6 digits indicating start position and the last 6 digits indicating end position. The 6 digits are used to represent a 4-digit decimal number: 0, thousands, hundreds, 0, tens, ones (e.g. “001013” for 113).
- ✧ One extraction option can only apply to one barcode type.

Example

When scanning a QR Code barcode, send the leftmost character through the 20th and the 113th character through the 140th of the data:

1. Scan the **Enter Setup** barcode.
2. Scan the **Enable Extraction** barcode.
3. Scan the **Program Extraction Option** barcode.
4. Scan the numberic barcodes in the following table, the **Save** barcode and the **Exit Setup** barcode.

Digit	033	000	000001	000020	000	001013	001040
Meaning	QR Code ID	Left to Right	Start with leftmost char	End with 20th char	Left to Right	Start with 113th char	End with 140th char

Barcode Type Section **Data Extraction Section 1** **Data Extraction Section 2**

Note:

1. Up to 3 data extraction sections are allowed for one 2D extraction option.
2. Neither the start position nor end position can be greater than 9999.
3. Data extraction sections can be overlapped. For instance, section 1: 1st character through the 50th (Left to Right); section 2: 2rd character through the 40th (Left to Right).
4. Start position can be greater than end position. In the example above, if data extraction section 1 is “000 000020 000001”, then the order of the extraction will be the 20th, 19th, 18th… and the leftmost.
5. To extract only one character, make start position equal to end position.

Data Packaging

Introduction

Data packing is designed for a specific group of users who want to have the data packed before transmission. Data packing influences data format, so it is advised to disable this feature when it is not required.

【Enter Setup】

**【Disable Data Packing】

Normal Pack

Normal Pack format: [STX + ATTR + LEN] + [AL_TYPE + DATA] + [LRC]

- ✧ STX: 0x02
- ✧ ATTR: 0x00
- ✧ LEN: Barcode data length is expressed in 2 bytes ranging from 0x0000 (0) to 0xFFFF (65535).
- ✧ AL_TYPE: 0x36
- ✧ DATA: Raw barcode data.
- ✧ LRC: Check digit.
  LRC calculation algorithm: computation sequence: 0xFF+LEN+AL_TYPE+DATA; computation method is XOR, byte by byte.

【Normal Pack】

**【Exit Setup】

0006010

【Enter Setup】

Chapter 9 Batch Programming

Introduction

Batch programming enables users to integrate a batch of commands into a single batch barcode .

Listed below are batch programming rules:

1. Command format: Command + “=” + Parameter Value.
2. Each command is terminated by semicolon. Note that there is no space between a command and its terminator semicolon.
3. The last command must be the **Save** command (0000160).
4. Use the barcode generator software to generate a 2D batch barcode.

Example: Create a batch barcode for **Illumination Always On** (0200030), **Sense Mode** (0302010), **Decode Session Timeout** (0313000) = 2s, **Disable the Discrete Lengths** for Interleaved 2 of 5 (0405140):

1. Input the commands:

   0200030; 0302010;0313000=2000; 0405140;0000160;

2. Generate a batch barcode.

When setting up a scanner with the above configuration, scan the **Enable Batch Barcode** barcode and then the batch barcode generated.

0001110

【Enable Batch Barcode】

0006000

**【Exit Setup】

Create a Batch Command

A batch command may contain a number of individual commands each of which is terminated by a semicolon. It must be ended with the **Save** command.

Command Structure: Command (+ "=" + Parameter Value)

4 command syntaxes are described as below:

1. **Syntax 1: Command**

   This syntax applies to most configuration situations.

   Example:

   Set the Baud Rate to 38400bps: **0100060**
   Enable the Sense Mode: **0302010**

2. **Syntax 2: Command + "=" + Decimal Digit(s)**

   This syntax applies to the options/features programming which requires the entry of parameter value (decimal), such as the Maximum/Minimum Length, Decode Session Timeout, Timeout Between Decodes (Same Barcode) and Sensitivity.

   Example:

   Set the Decode Session Timeout to 3000ms: **0313000=3000**
   Set the Sensitivity to (level) 10: **0312040=10**

3. **Syntax 3: Command + "=" + Hexadecimal Digit(s) (e.g., 0x101a, 0x2C03)**

   This syntax applies to the features/options programming like the Custom Prefix/Suffix, Terminating Character Suffix, Code ID Suffix, Set/Delete the Discrete Length and Program Extraction Option, which requires the entry of parameter value (hexadecimal).

   Example:

   Decode Interleaved 2 of 5 barcodes containing between 4 and 26 characters: **0405160=0x041a**
   Set the Terminating Character Suffix to CR/LF: **0310000=0x0d0a**

4. **Syntax 4: Command + "=" + Double Quotation Marks**

   For situations where the parameter value is visible character in Syntax 3, this syntax is also appropriate.

   Example:
   Set the Custom Prefix to AUTO-ID: **0300000="AUTO-ID"**

0006010

【Enter Setup】

Create a Batch Barcode

Batch barcodes can be produced in the format of PDF417, QR Code or DataMatrix.

Example: Create a batch barcode for **Ilumination Always On**, **Sense Mode**, **Decode Session Timeout** = 2s, **Disable the Discrete Lengths** for Interleaved 2 of 5:

1. Input the following commands:

   0200030;0302010;0313000=2000;0405140;0000160;

2. Generate a PDF417 batch barcode.

0006000

**【Exit Setup】

Use Batch Barcode

To put a batch barcode into use, scan the following barcodes.

0006010
【Enter Setup】

0001110
【Enable Batch Barcode】

【F】

Save/Cancel Barcodes

After reading numeric barcode(s), you need to scan the **Save** barcode to save the data. If you scan the wrong digit(s), you can either scan the **Cancel** barcode and then start the configuration all over again, or scan the **Delete the Last Digit** barcode and then the correct digit, or scan the **Delete All digits** barcode and then the digits you want.

For instance, after reading the **Maximum Length** barcode and numeric barcodes “1”, “2” and “3”, you scan:

- **Delete the Last Digit:** The last digit “3” will be removed.
- **Delete All Digits:** All digits “123” will be removed.
- **Cancel:** The maximum length configuration will be canceled. And the scanner still remains ready to read programming barcode.
